

## Brominator

Automatic dosing for bromine tablets  
Bromine is particularly suitable for disinfecting water and is released into the water using a dosage controlled dosing feeder. With the new bromine dosage feeder from BAYROL, the Aquabrome tablets are easily dissolved.

The dosing solution automatically enters directly into the circulation system via a bypass. The slowly dissolving tablets just need to be topped up every couple of weeks.

The new Brominator is made of particularly robust, long-lasting, maintenance-free material. It has a self-locking lid mechanism that protects against accidental opening. The transparent lid allows the contents to be checked without any difficulty.
