

PoolManager

The fourth generation of BAYROL PoolManager, one of the leading automatic water treatment systems has been fundamentally further developed. A great deal of value has been placed on user friendliness: using a large 5.7" touchscreen in association with well thought out controls sets new operating standards. A light touch of the finger on the screen is sufficient to reach the desired menu item.

Settings are made in exactly the same simple way. Every menu item is furnished with informative help texts. The PoolManager shows everything in clear text, and without any cryptic abbreviations. It has also been possible to make major simplifications for the initial operation: PoolManager requests particular parameters that are essential for initial operation.

This ensures that nothing is forgotten, and that the pool water is properly maintained and cared for from the very start. PoolManager also shows the user exactly what has to be done.
