

Gentle disinfection with bromine

The AQUABROME pool care system is one of the most effective and reliable care methods in existence. It protects your skin and eyes and avoids the smell of chlorine. It is unique as far as the simplicity of use while simultaneously providing excellent water quality.

Bromine – like chlorine – is a halogen, and eminently suitable for disinfecting swimming pool water. It works against bacteria, viruses and fungi, and eliminates organic contaminants in the water through oxidation.

Bromine has the following advantages over chlorine:

- No annoying, unpleasant chlorine smell
- Kind to skin and eyes
- Secure disinfection due to higher pH tolerance

It is particularly suitable for those places where the smell of chlorine is annoying, but where you cannot do without assured disinfection, e.g. in whirlpools. The effect of bromine is completely comparable with chlorine.

The very slow dissolving time of the Aquabrome tablets is ideal for when dosing with an economical, automatic dosage sluice.

Aquabrome® Tab

Care Steps contained:

- 

Slow-dissolving bromine tablets for enduring and additional disinfection.

Package size: 5 kg bucket
