

### Turbidity removal for crystal-clear water

You get crystal-clear water by removing the turbidity, i.e. through regular use of a flocculation agent. Water turbidity is mainly caused by tiny dirt particles suspended in the water, making it look cloudy and creating the optimum feeding ground for bacteria. These particles are so small that they cannot be filtered out. With the help of the flocculation agent even these finely distributed impurities can be filtered out.

### Turbidity removal when using cartridge filters

It is not possible to use a flocculation agent if you are using cartridge filters, because flocculation often results in these filters being coated and blocked by dirt and the flocculation agent. BAYROL has now filled this gap with SuperKlar turbidity remover.

### SuperKlar NEW!

Concentrated turbidity remover.

Package size: 0.5 litre bottle
