

VariTab

The new dimension
in water quality

BAYROL

Make your pool a simple pleasure

The 2-Layer Tablet for Quick and Long-term Disinfection

It's high time for a fundamentally new kind of pool water care.

BAYROL's research and development department have come up with a superior chlorine-based pool water treatment concept: **VariTab**.

The advantages of the 2-layer tablet

As you know the hygiene of swimmingpool water is a very important issue. You want pool water for your family and yourself that is not only superficially clear but hygienically clean? Then VariTab is good news for you. It defines new standards in water quality.

As the name suggests, VariTab is the first tablet with a two-layer, varied dissolving rate, giving several phases of disinfection and cleansing activity. VariTab is simply added to the skimmer and is foreseen for pools with sand filters. VariTabs are now available in the environmentally friendly 4.5 kg carton.

Layer 1:

Shock chlorination

The upper, blue tablet dissolves within about 10 minutes. Part of the chlorine contained in the blue tablet is fast dissolving and is immediately transferred into the pool water through the sand filter. This results in shock chlorination: the chlorine value rises noticeably for a short time, thus eliminating turbidity and killing any bacteria present.

Even the filter is cleansed and disinfected

VariTab is intelligent: the other part of the chlorine in the blue tablet is made up of large, slowly dissolving granules. These are deposited on the surface of the filter sand and for between about 30 and 60 minutes they intensively clean and disinfect the filter. This is especially important because the most frequent cause of bad water quality is a contaminated or soiled filter. Research has shown that virtually half the filters in use are either contaminated or soiled. VariTab finally provides the solution to this problem by acting where the dirt and bacteria are.

Layer 2:

Long-term disinfection, flocculation and hardness stabilisation

The lower white tablet dissolves slowly and is effective against bacteria, viruses and fungi for 1 to 2 weeks. So, following the shock chlorination, constant and thorough disinfection is guaranteed for the whole of the time it takes to dissolve. At the same time, a flocculant is continuously added to remove even the finest particles that cause turbidity. This makes the water much clearer. The hardness stabiliser which is also included works against calcium precipitations.

Result

The VariTab 2-layer tablet is an effective combination of fast and slow dissolving disinfectant and guarantees double hygienic safety. Moreover the sand filter is cleaned and disinfected. VariTab doesn't just make the pool water superficially clear; it also makes it hygienically clean.

VariTab, the new dimension in water quality.

For algae prevention BAYROL recommends Desalgin and Desalgin Jet!

Algae are plant micro-organisms that produce unwanted organic substances. These provide an ideal nutrient medium for bacteria and fungi.

Algae reproduce and proliferate quickly via spores, which are carried everywhere with dust particles present in the air. Disinfectants alone are not sufficient to prevent the formation of algae. Desalgin (low foaming) and Desalgin Jet (non-foaming) are the ideal complements to VariTab because algae may be resistant to chlorine. The chlorine may not penetrate the mucous covering of larger algae colonies. BAYROL algae prevention products of our highly concentrated product series Desalgin are ideal to disrupt the metabolic process of algae for them to die or to inhibit growth. Over the years, Desalgin products have continuously been optimised and they are effective against all types of algae. Free from heavy metals and chlorine, Desalgin does not irritate the skin or the eyes.

The superior combination of inherent substances of Desalgin does not only prevent algae growth, but it also inhibits the growth of bacteria and removes turbid substances from the swimming pool water, i.e. it contains a clarifying effect as well.
